Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Application No. Applicant(s) 10/542 179 SEEWALD, MARCUS J Office Action Summary Examiner Art Unit Elizabeth Gwartney 1794 -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --Period for Reply A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS. WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION. Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b). Status 1) Responsive to communication(s) filed on 2a) This action is FINAL. 2b) This action is non-final. 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under Ex parte Quayle, 1935 C.D. 11, 453 O.G. 213. Disposition of Claims 4) Claim(s) 1-17 is/are pending in the application. 4a) Of the above claim(s) _____ is/are withdrawn from consideration. 5) Claim(s) _____ is/are allowed. 6) Claim(s) 1-17 is/are rejected. 7) Claim(s) _____ is/are objected to. 8) Claim(s) _____ are subject to restriction and/or election requirement. Application Papers 9) The specification is objected to by the Examiner. 10) The drawing(s) filed on is/are; a) accepted or b) objected to by the Examiner. Applicant may not request that any objection to the drawing(s) be held in abevance. See 37 CFR 1.85(a). Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d). 11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152. Priority under 35 U.S.C. § 119 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f). a) All b) Some * c) None of: Certified copies of the priority documents have been received. 2. Certified copies of the priority documents have been received in Application No. 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)). * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Information Disclosure Statement

 The foreign and NPL documents cited in the information disclosure statement filed on August 01, 2005 and crossed out have not been considered because an English translation, English abstract, or statement of relevance has not been provided.

Claim Rejections - 35 USC § 103

- The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all
 obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
 - Determining the scope and contents of the prior art.
 - Ascertaining the differences between the prior art and the claims at issue.
 - Resolving the level of ordinary skill in the pertinent art.
 - Considering objective evidence present in the application indicating obviousness or nonobviousness.
- 4. Claims 5-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Robinson ("Fermented Meat Products" in Encyclopedia of Food Microbiology) in view of Rader ("Folic Acid Fortification, Folate Status, and Plasma Homocysteine") and as evidenced by Kerry et al. ("Ouality control of fermented meat products" in Meat Processing-Improving Quality).

Application/Control Number: 10/542,179

Art Unit: 1794

Regarding claims 5-7 and 9-10, Robinson discloses a method of making a semi-dry sausage, comprising the steps of providing minced beef, pork and pork fat, mixing the minced meat with additives including pepper, garlic, sugar, and cardamom, stuffing the mixture into natural or artificial casings, and storing the sausage for 9-23 days at a relative humidity of 58 - 95% and a temperature of 12-30° C (p. 744/Manufacture of Fermented Sausages/P1, p. 747/Table 1/Dry Sausage)

While Robinson discloses the addition of additives, the reference does not explicitly disclose adding from about 4 mg. to about 25 mg. per kilogram of meat a material selected from the group consisting of folic acid and folate.

Rader teaches that folic acid is a known nutritive additive in foods (Abstract). Rader teaches that folic acid fortification of food is intended to increase intake of folic acid among humans and reduce the risk of a pregnancy affected by a neural tube birth defect (NTD) and vascular disease (Abstract). Rader teaches that the addition of folic acid to enriched cereal-grain products became mandatory in the U.S. on January 1, 1998 at a level of 140 µg folic acid/100 g cereal-grain product (p. 2466S/Introduction).

Given that the improvement of the nutritional value of meat products has been tried for years (as evidenced by Kerry et al. - p. 382/Section 18.9.2), it would have been obvious to one of ordinary skill in the art to fortify the semi-dry sausage of Robinson with folic acid or folate, as taught by Rader. A skilled artisan would do so in order to increase the intake of folic acid or folate acid and reduce the risk of NTD-pregnancies and vascular disease.

While Rader teaches that folic acid is added to cereal-grain at a level of 140 µg folic acid/100 g, it is the examiner's position that folic acid concentration is a result effective variable

Application/Control Number: 10/542,179

Art Unit: 1794

because changing it would clearly affect the type of product obtained. See MPEP § 2144.05 (B). Case law holds that "discovery of an optimum value of a result effective variable in a known process is ordinarily within the skill of the art." See In re Boesch, 617 F.2d 272, 205 USPQ 215 (CCPA 1980). In view of this, it would have been obvious to one of ordinary skill in the art to utilize appropriate folic acid concentration, including that within the scope of the present claims, so as to produce desired end results.

Regarding claim 8, modified Robinson discloses all of the claim limitations as set forth above but the reference does not disclose that the material is added in a substantially uniform distribution during the step of adding spice. A skilled artisan would know to add ingredients to a food mixture in a uniform distribution in order to produce a homogenous product. It would have been obvious to one of ordinary skill in the art at the time of the invention to have added the material to the sausage of Robinson in a uniform distribution for the purpose of making a product homogenous in flavor, texture and nutritional value.

Regarding claim 11, modified Robinson discloses all of the claim limitations as set forth above but the reference fails to disclose the step of washing the sausage in water. A skilled artisan would know to wash a stuffed sausage product prior to ripening in order to remove undesirable bacteria and debris. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have washed the sausage of modified Robinson with water to remove undesirable debris and prevent contamination for undesirable bacteria, yeast, and molds.

Regarding claim 12, modified Robinson discloses all of the claim limitations as set forth above and that yeast and molds commonly develop on the surface of the fermented sausage Application/Control Number: 10/542,179

Art Unit: 1794

during ripening (p. 745/Manufacture of Fermented Sausages/P2). Further, Robinson discloses that to ensure reliability of the quality of fermented meat products, starter cultures are used (p. 745/Desirable Flora/P3). As starter cultures, molds such as *Penicillium nalviogense*, *P. chrysogenum* or *P. camemberti* are added to the surface of the sausage casing (p. 746/Starter Cultures for Fermented Sausages/P1). While Robinson does not explicitly disclose that the mold is dissolved in water, it would have been obvious to one of ordinary skill in the art at the time of the invention to have treated the exterior of the sausage with a mold starter culture dissolved in water to ensure an even distribution of the culture over the exterior of the entire sausage casing.

Regarding claims 13-17, modified Robinson discloses all of the claim limitations as set forth above. Robinson also discloses storing the sausage for 9-23 days with an initial 18-48 hours at 58-95% humidity and a temperature of 20-30°C and thereafter stored at a relative humidity of 75-80% and a temperature of 12-15°C (p. 747/Table 1/Dry sausage).

While Robinson discloses storing the sausage for a total of 9-24 days with a 48 hour period of fermentation at a relative humidity of 58-95% and a temperature of 20-30°C (p. 747/Table 1/Dry sausage), the reference does not disclose a period of fermentation lasting 3 days or an additional two days at a relative humidity of about 88% and temperature of 22°C.

As flavor intensity, flavor character and fermentation rate are variables that can be modified, among others, by adjusting the time, humidity and temperature of sausage storage within the range disclosed by Robinson, the precise storage time, humidity, and temperature would have been considered a result effective variable by one having ordinary skill in the art at the time the invention was made. As such, without showing unexpected results, storage time, humidity and temperature cannot be considered critical within the range disclosed by Robinson.

Art Unit: 1794

Accordingly, one of ordinary skill in the art at the time the invention was made would have optimized by routine experimentation the time, humidity, and temperature of each phase of sausage storage to obtain the desired balance between fermentation rate and flavor intensity and character. (In re Boesch, 617 F.2d. 272, 205 USPQ 215 (CCPA 1980)), since it has been held that where the general conditions of the claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art. (In re Aller, 105 USPQ 223).

Conclusion

- The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
 - -Raccach et al. (EPO 0 130 228 A1) discloses a method for producing fermented meats by generating lactic acid in the meat using a culture of a lactobacillus that provides rapid fermentation but the reference does not disclose the uniform addition of folic acid or folate.
- 6. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Elizabeth Gwartney whose telephone number is (571) 270-3874. The examiner can normally be reached on Monday Thursday;7:30AM 5:00PM EST, working alternate Fridays.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Callie Shosho can be reached on (571) 272-1123. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
